Bringing MMFF to the RDKit

Paolo Tosco

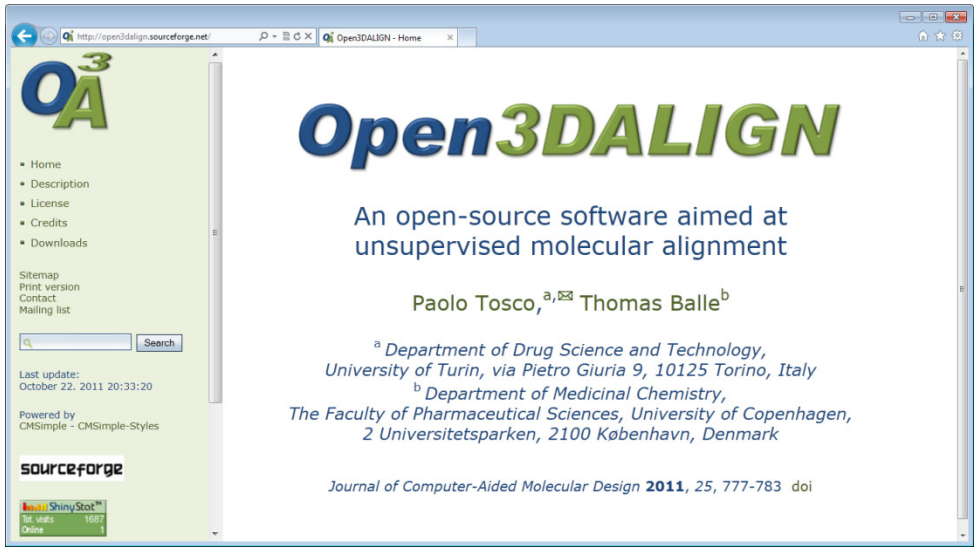
RDKit User Group Meeting 2013

October 2–4, European Bioinformatics Institute, Hinxton, UK

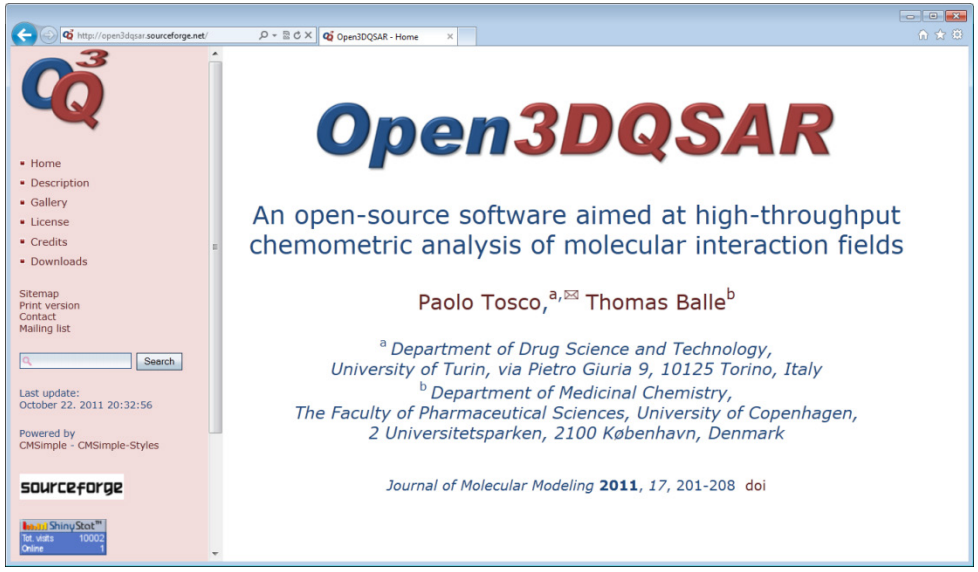
Topics

- The MMFF implementation
- UFF gains something, too
- MMFF applications

Open3DTOOLS: Open3DQSAR & Open3DALIGN



- **Open3DALIGN**
  - conformational search
  - molecular alignment
    - single/multiple conformations
    - atom-based/pharmacophore-based/mixed alignment
    - single-run/iterative



- **Open3DQSAR**
  - MIF computation
  - PLS model building and validation
  - variable selection

Why bringing MMFF to the RDKit?

- Preliminary step before implementing ***Open3DQSAR*** and ***Open3DALIGN*** functionality
- In principle, only MMFF atom types and charges are needed for that purpose…
- …but one shouldn't be lazy, right? ;-)

MMFF94 documentation

Merck Molecular Force Field. I. Basis, Form, Scope, Parameterization, and Performance of MMFF94*

Merck Molecular Force Field. II. MMFF94 van der Waals and Electrostatic Parameters for Intermolecular Interactions*

Merck Molecular Force Field. III. Molecular Geometries and Vibrational Frequencies for MMFF94*

Merck Molecular Force Field. IV. Conformational Energies and Geometries for MMFF94*

Merck Molecular Force Field. V. Extension of MMFF94 Using Experimental Data, Additional Computational Data, and Empirical Rules*

MMFF VI. MMFF94s Option for Energy Minimization Studies

MMFF VII. Characterization of MMFF94, MMFF94s, and Other Widely Available Force Fields for Conformational Energies and for Intermolecular-Interaction Energies and Geometries

MMFF94(s) is fully documented by a series of 7 papers published by Halgren and Nachbar (Merck) on *J. Comp. Chem.* between 1995 and 1998

MMFF94 energy expression: 7 terms

$$E_{MMFF} = \sum EB_{ij}$$ bond stretching

$$EB_{ij} = 143.9325 \frac{kb_{ij}}{2} \Delta r_{ij}^2 \left(1 + cs\Delta r_{ij} + \frac{7}{12} cs^2 \Delta r_{ij}^2\right)$$

$$+ \sum EA_{ijk}$$ angle bending

$$EA_{ijk} = 0.043844 \frac{ka_{IJK}}{2} \Delta \vartheta_{ijk}^2 \left(1 + cb\Delta \vartheta_{ijk}\right)$$

$$+ \sum EBA_{ijk}$$ stretch-bend

$$EBA_{ijk} = 2.51210\left(kba_{IJK}\Delta r_{ij} + kba_{KJI}\Delta r_{kj}\right)\Delta \vartheta_{ijk}$$

$$+ \sum EOOP_{ijk;l}$$ out-of-plane bending

$$EOOP_{ijk;l} = 0.043844 \frac{koop_{IJK:L}}{2} \chi_{ijk;l}^2$$

$$+ \sum ET_{ijkl}$$ torsion

$$ET_{ijkl} = 0.5\left[V_1\left(1 + \cos\phi\right) + V_2\left(1 - \cos 2\phi\right) + V_3\left(1 + \cos 3\phi\right)\right]$$

$$+ \sum EvdW_{ij}$$ van der Waals

$$EvdW_{ij} = \varepsilon_{IJ} \left(\frac{1.07R_{IJ}^*}{R_{ij} + 0.07R_{IJ}^*}\right)^7 \left(\frac{1.12R_{IJ}^{*7}}{R_{ij}^7 + 0.12R_{IJ}^{*7}} - 2\right)$$

$$+ \sum EQ_{ij}$$ electrostatic

$$EQ_{ij} = 332.0716 \frac{q_i q_j}{D\left(R_{ij} + \delta\right)^n}$$

Validation of the RDKit MMFF implementation

The RDKit implementation was validated against the official MMFF94 (761 molecules) and MMFF94s (265 molecules) validation suites available in the CCL data archives (both dative and hypervalent notations):

`http://ccl.net/chemistry/resources/data/index.shtml`

- All atoms are assigned correct MMFF types and charges
- All force-field terms are assigned correct force constants
- All MMFF energies are correctly computed
- Gradients were also validated against the TINKER MMFF implementation

- Even better, atom type, charge and force constants are correctly assigned also starting from SMILES representations of the validation suite molecules

- MMFF validation is included as part of the RDKit test suite (`Code/ForceField/MMFF/testMMFFForceField.cpp`)

Force-field wish list (open to suggestions)

- GBSA implicit solvation model

During energy minimization, support for:

- Fixed atoms
- Harmonic constraints on selected atoms/groups
- Internal coordinate constraints
  (in addition to distances, also angles and torsions)

Topics

- The MMFF implementation
- UFF gains something, too
- MMFF applications

UFF issue 62

The RDKit implementation of UFF had an issue connected with sp^2 atoms lacking planarity in 3- and 4-membered rings

(Lack of) Planarity of some generated atomic coordinates after minimisation.

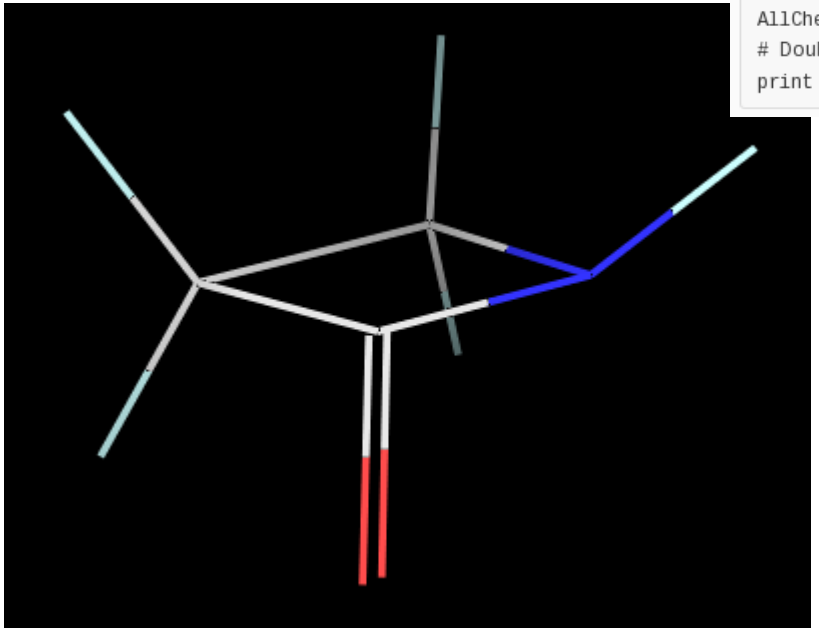
greglandrum is assigned Milestone: **2013_09_1**

The problem is the lack of an inversion term in the RDKit implementation of UFF. This is definitely solvable (UFF has an inversion term, we just never implemented it), but it will probably take some time.

```
#!/usr/bin/env python

from rdkit import Chem
from rdkit.Chem import AllChem

# a simple mol in a simple world
m = Chem.MolFromSmiles("C1C(=O)NC1")
# the usual recipe
Chem.AddHs(m)
AllChem.EmbedMolecule(m)
# Opt
AllChem.UFFOptimizeMolecule(m)
# Double bond O should be planar - it is not
print >>file('wrong_structure.sdf','w'),Chem.MolToMolBlock(m)
```

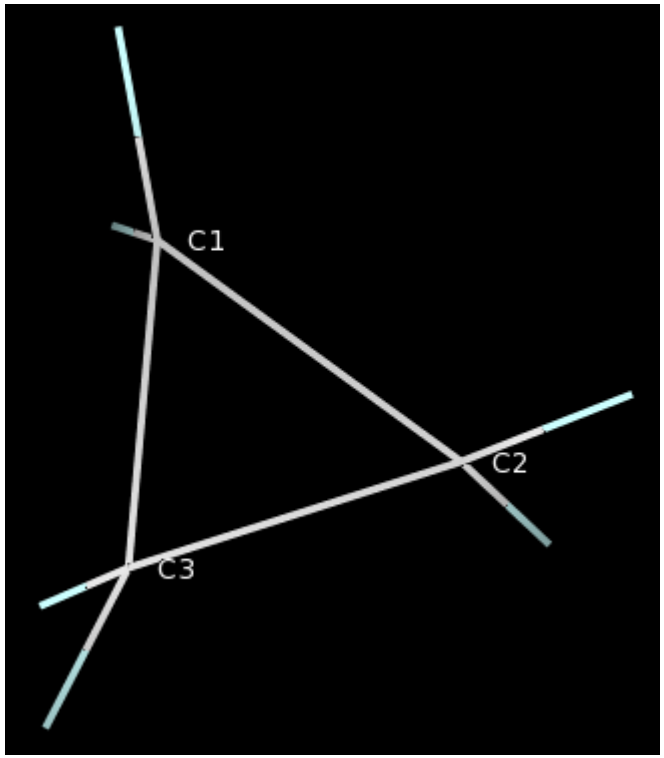


- The issue is arguably connected with the lack of the inversion term
- Back-porting the OOP term from MMFF to UFF should most likely fix things

Angle enumeration

```
PyMOL>get_angle id 1, id 2, id 3
 cmd.get_angle: 56.674 degrees.
PyMOL>get_angle id 1, id 3, id 2
 cmd.get_angle: 66.654 degrees.
PyMOL>get_angle id 2, id 1, id 3
 cmd.get_angle: 56.672 degrees.
```

```
PyMOL>get_distance id 1, id 2
 cmd.get_distance: 1.610 Angstroms.
PyMOL>get_distance id 1, id 3
 cmd.get_distance: 1.465 Angstroms.
PyMOL>get_distance id 2, id 3
 cmd.get_distance: 1.465 Angstroms.
```

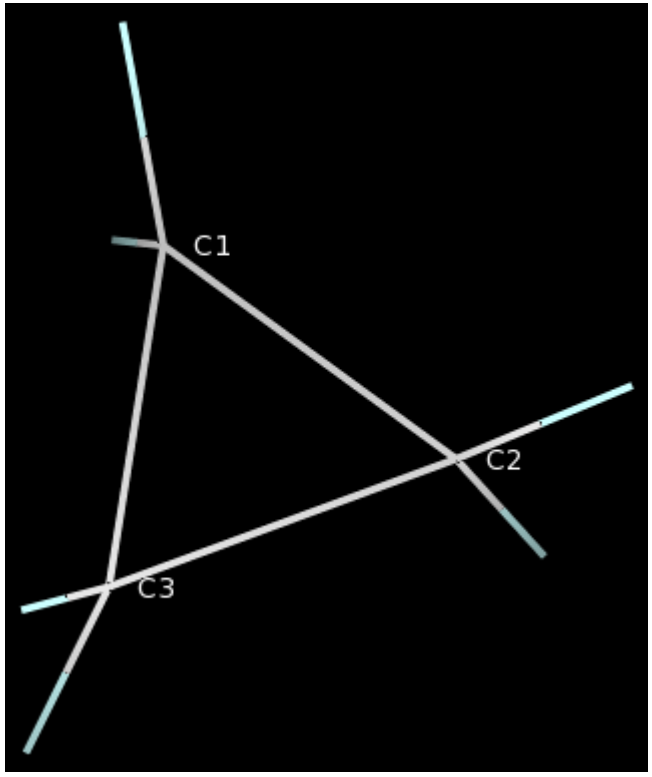


- I noticed that also geometries of small rings containing only sp^3 atoms were somehow ill
- Angle enumeration in UFF was implemented using the same `neighborMatrix` used for non-bonded interactions
- However, since atoms C1, C3 are connected both directly and through atom C2 and the matrix has only one node per atom pair, some angle terms may be missing

Angle enumeration

```
PyMOL>get_angle id 1, id 2, id 3
 cmd.get_angle: 60.003 degrees.
PyMOL>get_angle id 1, id 3, id 2
 cmd.get_angle: 59.998 degrees.
PyMOL>get_angle id 2, id 1, id 3
 cmd.get_angle: 59.999 degrees.
```

```
PyMOL>get_distance id 1, id 2
 cmd.get_distance: 1.517 Angstroms.
PyMOL>get_distance id 1, id 3
 cmd.get_distance: 1.517 Angstroms.
PyMOL>get_distance id 2, id 3
 cmd.get_distance: 1.517 Angstroms.
```



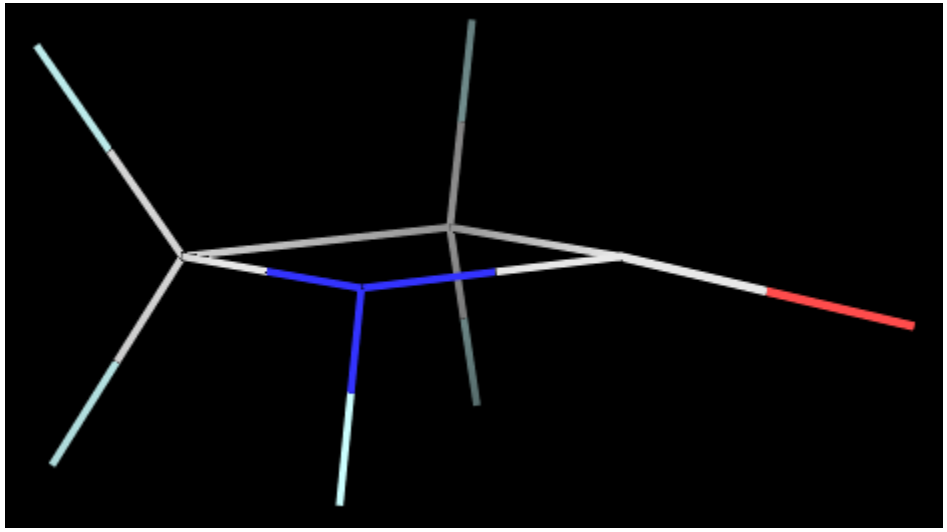
- Both in MMFF and UFF a graph-based method is now used for angle enumeration, while `neighborMatrix` is used only for non-bonded interactions
- This also allows reducing the size of `neighborMatrix` nodes from a 32-bit `int` to 2 bits, resulting in a 256-fold lower RAM usage
- All torsions are now included also in 3-membered rings
- Angles and distances now look OK

Implementation of inversions in UFF

- Then, I implemented inversions according to the original paper by Rappé et al.:

UFF, a Full Periodic Table Force Field for Molecular Mechanics and Molecular Dynamics Simulations

A. K. Rappé,* C. J. Casewit,‡ K. S. Colwell, W. A. Goddard III,# and W. M. Skiff†



- After making sure that the inversion code was working properly, I ran the script which triggered issue 62:

```
# a simple mol in a simple world
m = Chem.MolFromSmiles("C1C(=O)NC1")
m2 = Chem.AddHs(m)
AllChem.EmbedMolecule(m2)
pyFF = AllChem.UFFGetMoleculeForceField(m2)
pyFF.Minimize()
print >>file('uff_beta-lactam.sdf','w'), \
  Chem.MolToMolBlock(m2)
```

The geometry improved slightly,
but was still far from being satisfactory! Very disappointing.

What is going wrong?

- Investigations on the details of the UFF implementation revealed minor discrepancies with respect to Rappé's paper, which anyway had no impact on the geometries of small rings containing sp^2 atoms

Typos and comments for UFF

There are some obvious typos in the UFF paper, and I believe there are a few subtle ones as well. Here I list places where my implementation does not completely agree with what is written in the UFF paper.

- Equation (2) of Rappe *et al.* 1992 is written as follows.
  $r_{IJ} = r_I + r_J + r_{BO} + r_{EN}$
  However, this method does not result in agreement with their published equilibrium bond lengths. Anthony Rappe informed me that this equation is in error and I have instead implemented the following (beginning with Version 4.4.2).
  $r_{IJ} = r_I + r_J + r_{BO} - r_{EN}$
- Equation (13) of Rappe *et al.* 1992 is written with some mistakes in the superscripts and subscripts. Here is the equation as implemented into Towhee (beginning with Version 4.4.2).
  $K_{IJK} = beta\ (\ Z_I^*\ Z_K^*\ /\ r_{IK}^5\ )\ r_{IJ}\ r_{JK}\ [\ 3\ r_{IJ}\ r_{JK}\ (1 - Cos^2(theta_0)\ )\ -\ r_{IK}^2\ Cos(\ theta_0\ )\ ]$
- Equation 10 and the preceding text in Rappe *et al.* 1992 does not accurately reflect the implementation of bending angles in UFF. For the linear case the equation should actually read
  $U = K_{IJK}/n^2\ [\ 1 + Cos(n\ theta)]$

- During my investigations I also ran across these suggestions by Marcus Martin, the author of Towhee, who found some typos/mistakes in the original paper. However, none of these fixes solved issue 62

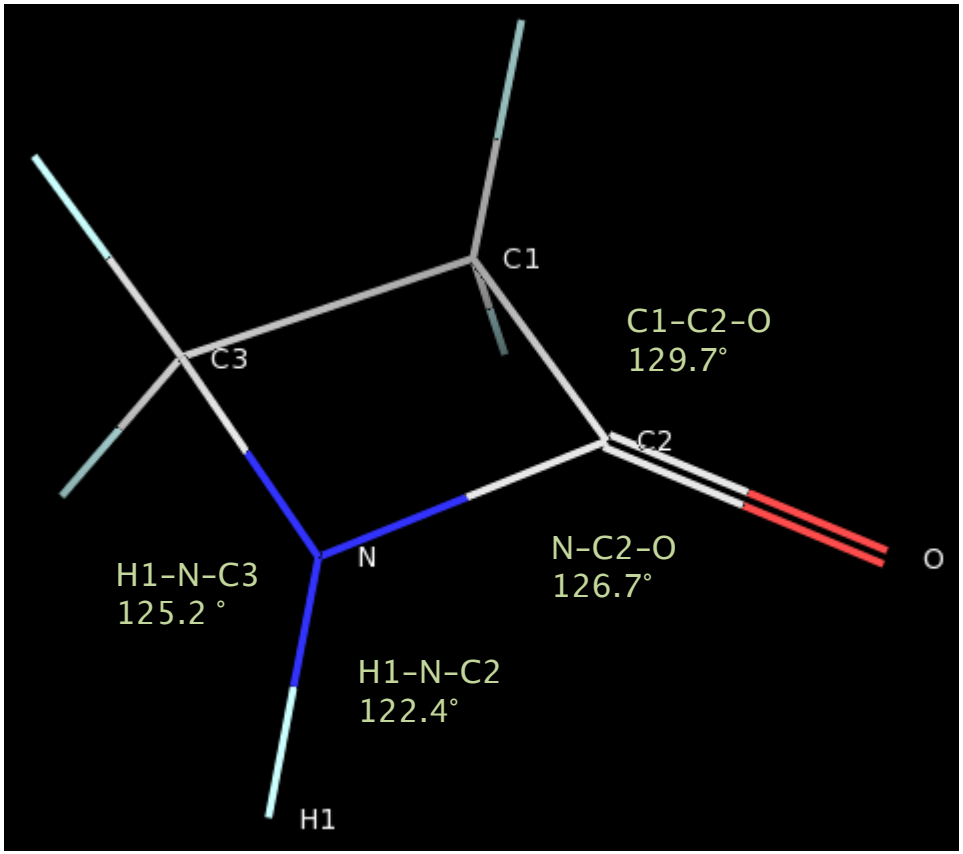
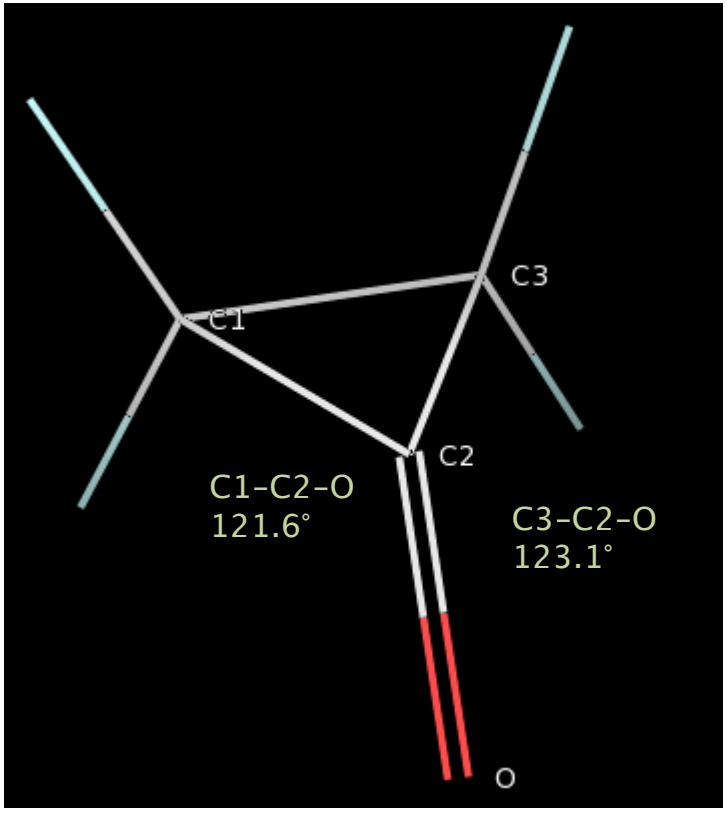
Competition between angle and OOP bend terms

RDKit UGM 2013
October 2-4, EBI, Hinxton, UK



- Measuring the angles involving two edges of the small ring and an exocyclic atom shows that such angles are close to 120°, which is the equilibrium angle for sp^2 atoms

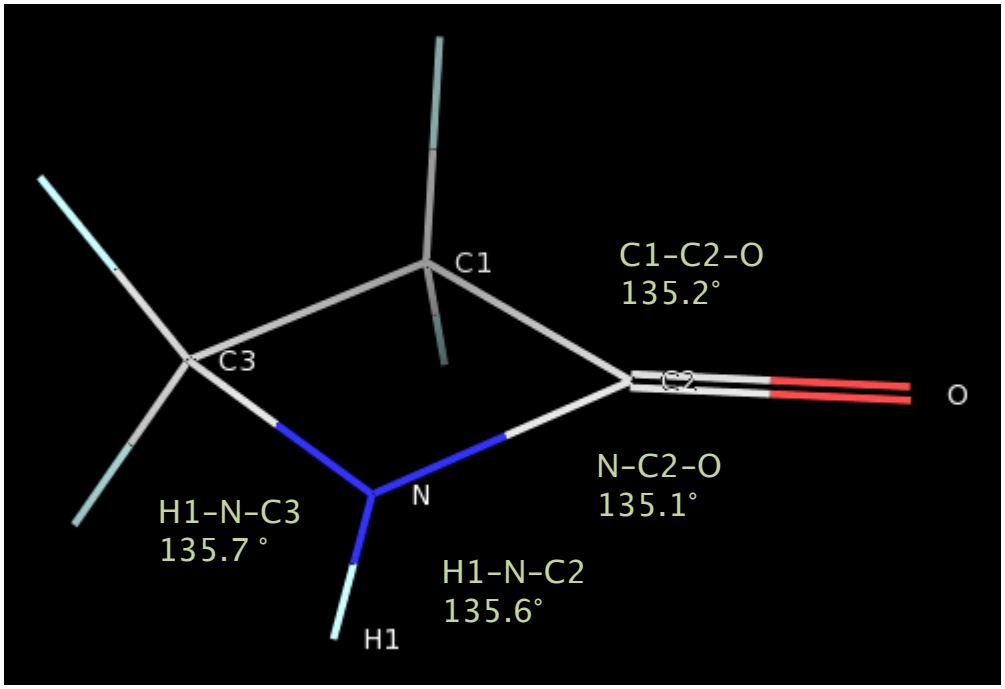


- There seems to be a competition between angle and OOP bend terms, the first pulling the exocyclic atom out-of-plane, the second trying to keep it coplanar with the ring

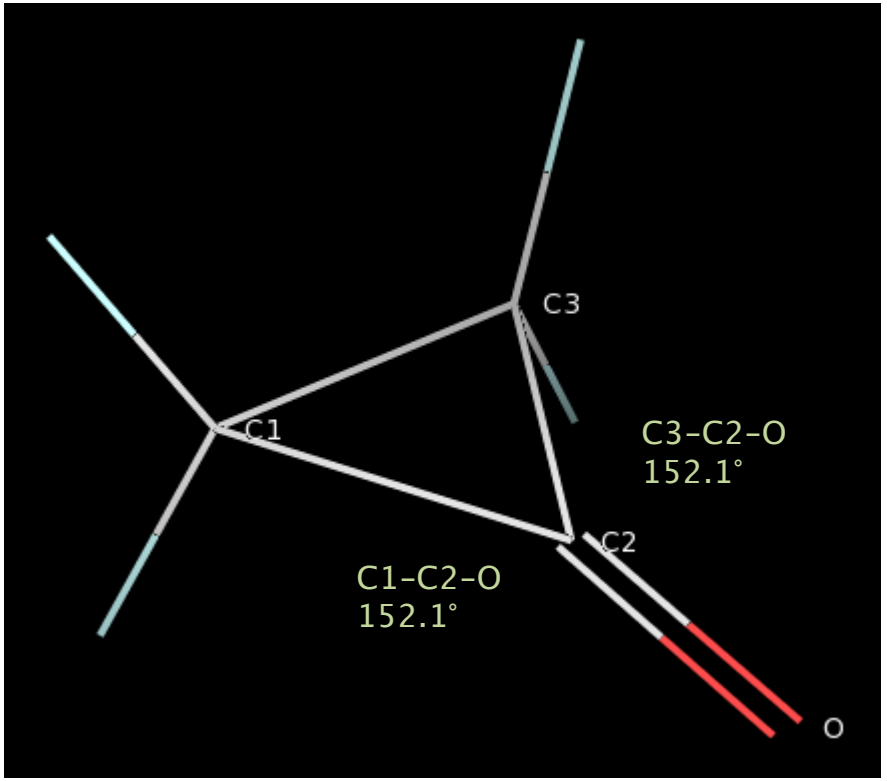
DSTF
Dipartimento di Scienza e Tecnologia del Farmaco
UNIVERSITÀ DI TORINO

Hacking UFF equilibrium angles for small rings

RDKit UGM 2013
October 2-4, EBI, Hinxton, UK



- I set equilibrium values for exocyclic angles involving sp^2 atoms to 135° and 150°, and endocyclic angles to 90° and 60° for 4- and 3-membered rings, respectively



- Now exocyclic sp^2 atoms are coplanar with the ring, as they should be
- Please note that this hack impacts only on sp^2 atoms in 3- and 4-membered rings

Small ring geometries obtained with original UFF, hacked UFF, AM1

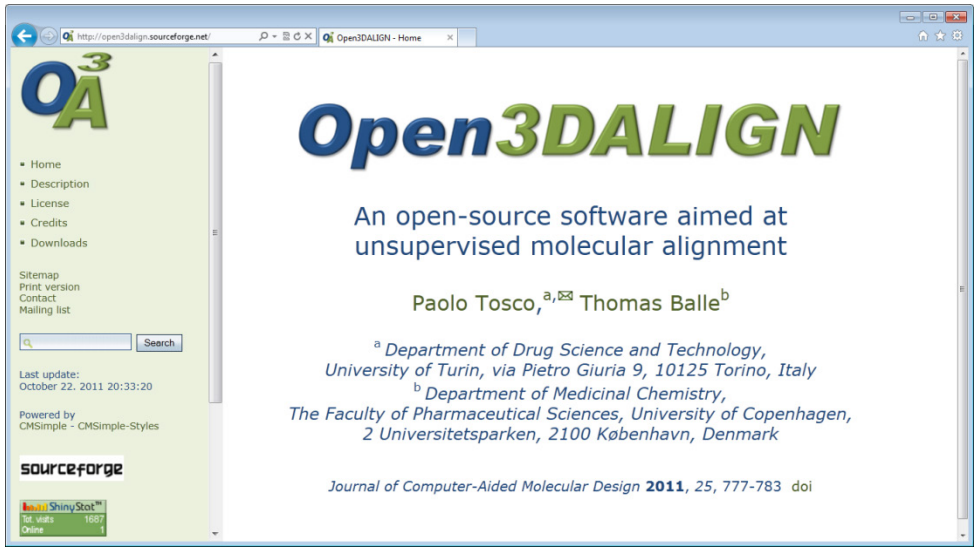
Implementing Open3DALIGN in the RDKit



- **Open3DALIGN**
  - molecular alignment
    - single/multiple conformations
    - atom-based alignment
    - single-run

- **Open3DQSAR**
  - MIF computation
  - PLS model building and validation
  - variable selection

Open3DALIGN alignment strategy: 1st step

Open3DALIGN uses a 2-step alignment strategy

1

- a cost function c_{ij} is computed for pairing heavy atoms i,j between reference (R) and probe (P) molecules

c_{00}	c_{01}	c_{02}	c_{03}	c_{04}	c_{05}	c_{06}	c_{07}	c_{08}	c_{09}
c_{10}	c_{11}	c_{12}	c_{13}	c_{14}	c_{15}	c_{16}	c_{17}	c_{18}	c_{19}
c_{20}	c_{21}	c_{22}	c_{23}	c_{24}	c_{25}	c_{26}	c_{27}	c_{28}	c_{29}
c_{30}	c_{31}	c_{32}	c_{33}	c_{34}	c_{35}	c_{36}	c_{37}	c_{38}	c_{39}
c_{40}	c_{41}	c_{42}	c_{43}	c_{44}	c_{45}	c_{46}	c_{47}	c_{48}	c_{49}
c_{50}	c_{51}	c_{52}	c_{53}	c_{54}	c_{55}	c_{56}	c_{57}	c_{58}	c_{59}

i

j

$$c_{ij} = w_1 \left| q(R)_i - q(P)_j \right| + w_2 s_{ij} + \sum_{k=1}^{K} \frac{\left(h(P)_{ik} - h(R)_{jk} \right)^2}{h(P)_{ik} + h(R)_{jk}}$$

$q(R)_i$, $q(P)_j$	MMFF94 charges of atoms
s_{ij}	degree of chemical similarity between MMFF94 atom types i and j
$h(R)$, $h(P)$	K-binned histograms whose k-th bin represents the number of atoms in R and P lying in a (k-1, k) distance range from the i-th and j-th atom, respectively

Open3DALIGN alignment strategy: 1st step

Open3DALIGN uses a 2-step alignment strategy

1

- The total matching cost is minimized via the Jonker-Volgenant algorithm yielding an **E** matrix which describes intermolecular atom pairings

c_{00}	c_{01}	c_{02}	c_{03}	c_{04}	c_{05}	c_{06}	c_{07}	c_{08}	c_{09}
c_{10}	c_{11}	c_{12}	c_{13}	c_{14}	c_{15}	c_{16}	c_{17}	c_{18}	c_{19}
c_{20}	c_{21}	c_{22}	c_{23}	c_{24}	c_{25}	c_{26}	c_{27}	c_{28}	c_{29}
c_{30}	c_{31}	c_{32}	c_{33}	c_{34}	c_{35}	c_{36}	c_{37}	c_{38}	c_{39}
c_{40}	c_{41}	c_{42}	c_{43}	c_{44}	c_{45}	c_{46}	c_{47}	c_{48}	c_{49}
c_{50}	c_{51}	c_{52}	c_{53}	c_{54}	c_{55}	c_{56}	c_{57}	c_{58}	c_{59}

i

j

- The **E** matrix is then ranked and trimmed to give a **D** matrix, whose atom pairs are least-square-fitted

i	*j*
4	0
2	2
0	3
3	5
5	7
1	8

i	*j*
5	7
1	8
3	5
2	2

Open3DALIGN uses a 2-step alignment strategy

2

- This initial, coarse alignment is then iteratively refined via the SDM algorithm and scored
- Optionally, cost function parameters may be iteratively optimized until the best scoring alignment is found

Scoring function:

$$s = \sum_{k=1}^{p} \left(\alpha + \frac{1 + \beta \cdot \left| q(R)_{D[k,0]} + q(P)_{D[k,1]} \right|}{1 + \left| q(R)_{D[k,0]} - q(P)_{D[k,1]} \right|} \right) \cdot \exp\left(-\gamma \cdot r^2_{D[k,0]D[k,1]} \right)$$

Open3DALIGN: the RDKit implementation

- The RDKit already implements least-square-fit and 3D transformation functions dedicated to molecular alignment:

- `double getAlignmentTransform (const ROMol &prbMol, const ROMol &refMol, RDGeom::Transform3D &trans, int prbCid = -1, int refCid = -1, const MatchVectType *atomMap = 0, const RDNumeric::DoubleVector *weights = 0, bool reflect = false, unsigned int maxIters = 50)`
- `double alignMol (ROMol &prbMol, const ROMol &refMol, int prbCid = -1, int refCid = -1, const MatchVectType *atomMap = 0, const RDNumeric::DoubleVector *weights = 0, bool reflect = false, unsigned int maxIters = 50)`

- All we need is to generate via the **Open3DALIGN** functionality a `MatchVectType` with matching atom pairs and a `RDNumeric::DoubleVector` with weights, and pass them to the least-square-fit function

O3A class: methods (C++)

```
O3A o3a(ROMol &prbMol, const ROMol &refMol, MMFF::MMFFMolProperties *prbMP,
  MMFF::MMFFMolProperties *refMP, const int prbCid = -1, const int refCid = -1,
  const bool reflect = false, const unsigned int maxIters = 50,
  const unsigned int options = O3_USE_MMFF_WEIGHTS, LAP *extLAP = NULL)
```

```
// align probe onto reference (returns RMSD)
double rmsd = o3a.align()

// get RMSD and transformation which overlays probe and reference molecules
std::pair<double, RDGeom::Transform3D *> rmsdTrans = o3a.trans()

// get the O3AScore value of the alignment (no need to actually align coordinates)
double o3aScore = o3a.score()

// get the MatchVectType vector
const RDKit::MatchVectType *matches = o3a.matches()

// get the weight vector
const RDNumeric::DoubleVector *weights = o3a.weights()
```

O3A class: methods (Python)

```
GetO3A(prbMol, refMol, prbPyMMFFMolProperties, refPyMMFFMolProperties,
  prbCid = -1, refCid = -1, reflect = False, maxIters = 50, options = O3_USE_MMFF_WEIGHTS)
```

```
# align probe onto reference (returns RMSD)
rmsd = o3a.Align()

# get RMSD and transformation which overlays probe and reference molecules
(rmsd, trans) = o3a.Trans()

# get the O3AScore value of the alignment (no need to actually align coordinates)
o3aScore = o3a.Score()

# get the MatchVectType vector
matches = o3a.Matches()

# get the weight vector
weights = o3a.Weights()
```

Align all molecules in a SDF file on a common reference (C++)

O3A alignment (Python)

Align all molecules in a SDF file on a common reference (Python)

```
from rdkit import Chem
from rdkit.Chem import AllChem

sdf = 'ref_e2.sdf'
o3aSdf = 'ref_e2_PyO3A.sdf'
supplier = Chem.SDMolSupplier(sdf, True, False)
nMol = len(supplier)
refNum = 48
refMol = supplier[refNum]
refPyMP = AllChem.MMFFGetMoleculeProperties(refMol)
o3aMol = Chem.SDWriter(o3aSdf)
print 'N\t\tSCORE\t\tRMSD'
for prbNum in range(0, nMol):
  prbMol = supplier[prbNum]
  prbPyMP = AllChem.MMFFGetMoleculeProperties(prbMol)
  pyO3A = AllChem.GetO3A \
    (prbMol, refMol, prbPyMP, refPyMP)
  print '{0:}\t\t{1:.2f}\t\t{2:.2f}'.format(prbNum + 1, pyO3A.Score(), pyO3A.Align())
  o3aMol.write(prbMol)
o3aMol.close()
```

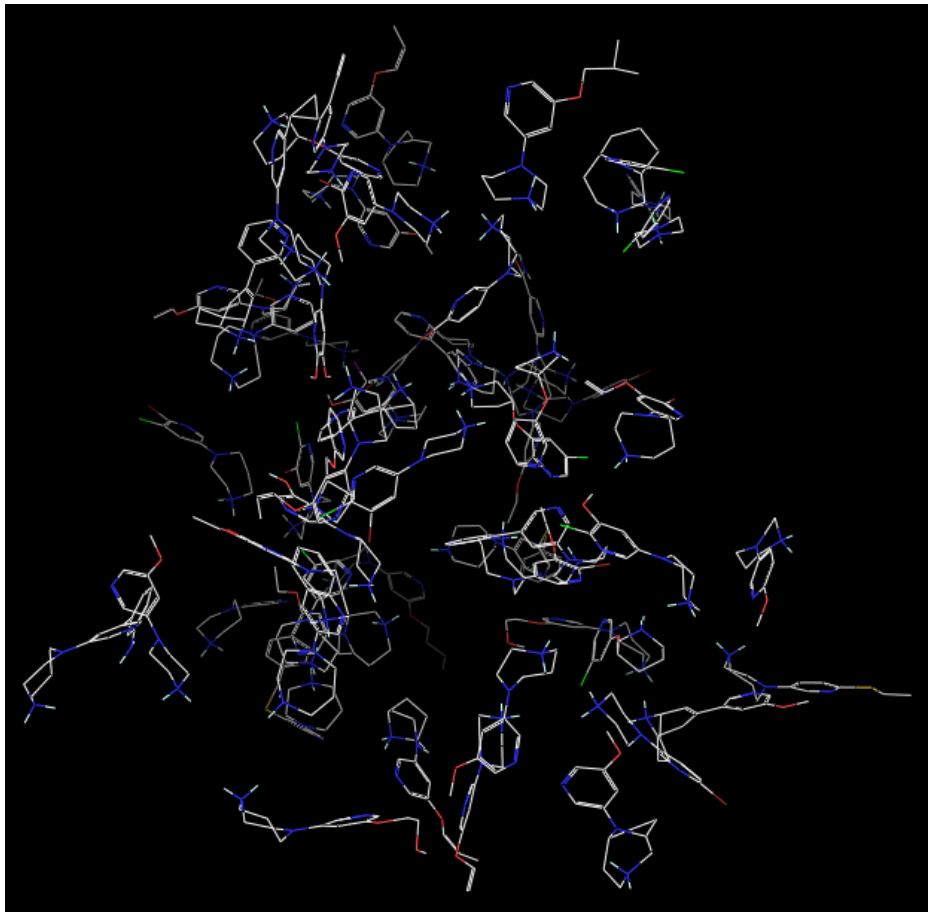
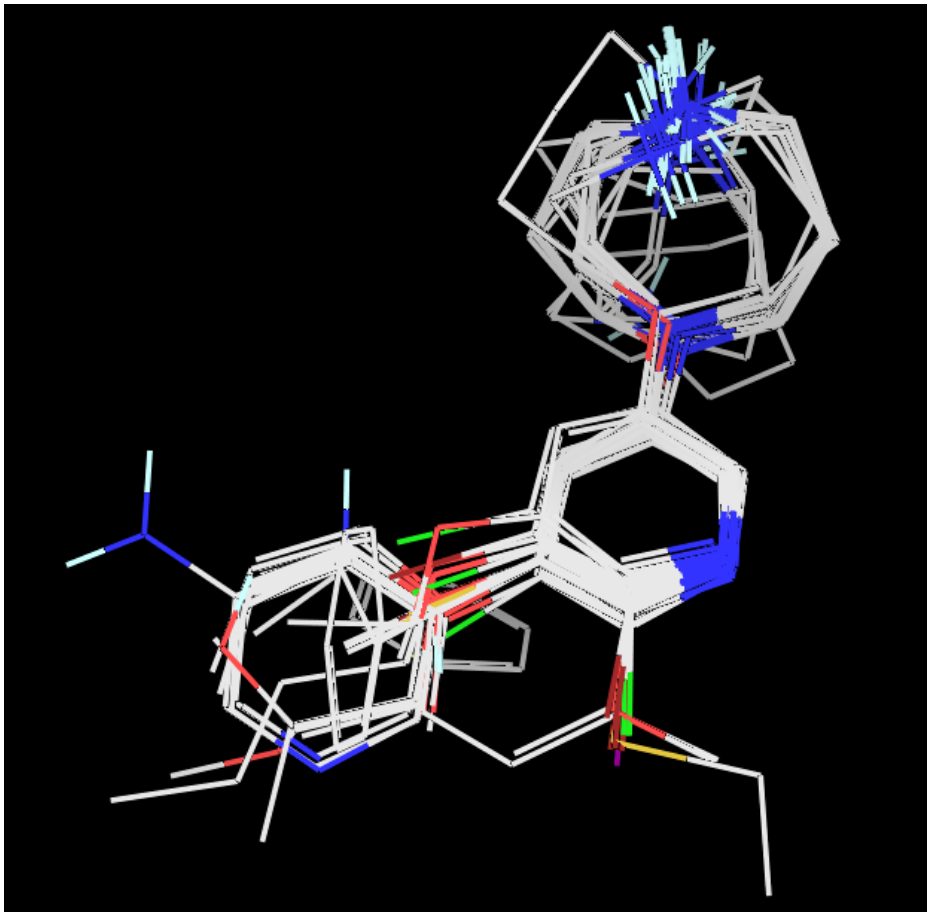
O3A alignment: before and after

Before

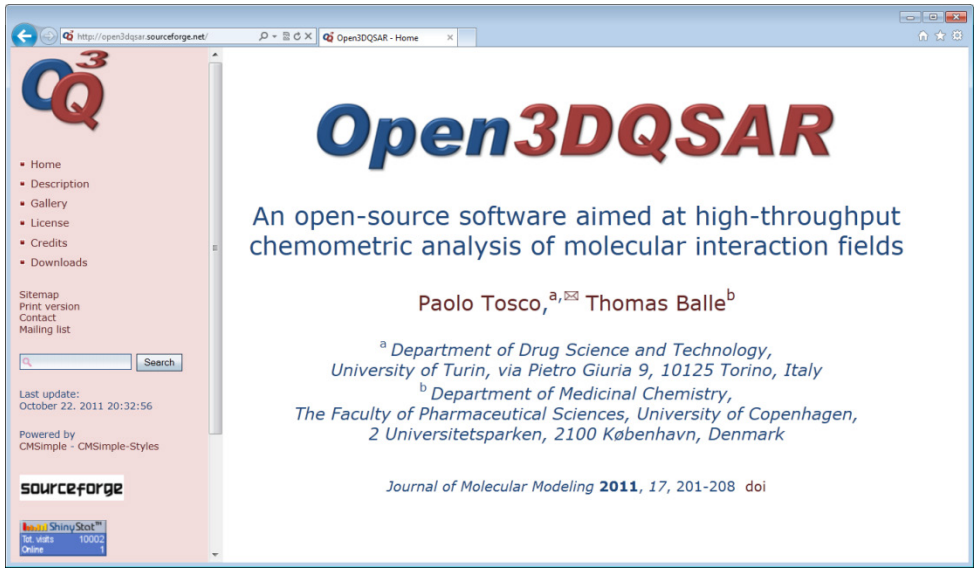


After



What next?

- Methods to perform OOTB multi-conformational and multi-threaded alignment
- Iterative refinement of overlays
- Implementation of O3Q functionality



- **Open3DQSAR**
  - MIF computation
  - PLS model building and validation
  - variable selection

Thanks

- To Nik and Greg
- To NIBR for funding
- To all scientists who publish their science in such an open, clear and truly reproducible form as Halgren did with MMFF
